

# Choosing Paint Booth Filters: Fiberglass or Polyester?

## FIBERGLASS

Fiberglass filter media is a dense structure of fine fiberglass fibers that has long been available within the industry.

Beacon Equipment stocks Extra Density 22g Filters (lower density available as a special order) offering an economical option for a combination of service life, paint holding capacity & efficiency. Available in both rolls & pads.

## POLYESTER

Polyester filter media has a much less dense structure made of coarse fibers. Polyester filters have a reputation of being heavy-duty and long-lasting. Polyester filters offer the best value through more cost savings due to reduced filter changes & reduced exhaust pit, chamber & fan cleaning requirements.

Available in both rolls & pads.

In short, fiberglass filtration is powerful & offers immediate cost savings benefits, while Polyester filtration tends to offer longer-lasting filtration leading to long term cost savings & value.
